Dear Retail Store Owner,

Scratch and Peck Feeds provides quality chicken, turkey, goat, pig, and sheep formulas as well as whole grains and a variety of supplements. Their formulas are rich in Omega-3 fatty acids and essential vitamins to providing animals with the ingredients to optimize health.

Their mill is located in Bellingham, Washington, just north of Skagit Valley farmland and the surrounding Seattle area.

I am bringing you this letter to inform you about these quality products and request that you become a supplier of their feeds so I can purchase them from you.

Please check out their website for a more detailed product description and company profile.

Your Customer,

Date

Scratch and Peck Company Highlights

Non GMO

We believe in using only time-tested, natural ingredients in our products. Because long scale information is lacking on the safety of genetically modified organisms to human and animal health and the environment, we use only non-GMO ingredients in our feeds.

Naturally High in Omega-3

Camelina sativa meal and oil provide our feed with high Omega-3 fatty acids and essential vitamins. Studies have shown beneficial fats are passed into yolks and can improve cholesterol and blood lipids. Additionally, Camelina is rich in vitamin E, a powerful antioxidant.

Washington Grown

Because we buy organic grain directly from Washington farmers, we are able to support farmers directly, helping grow local and rural economies. In addition, because our grain has fewer miles to travel, we are able to save fuel, reducing our carbon footprint

Whole Grain

When a grain is cracked or ground, oxidation occurs faster which can lead to the rancidification of nutritious fats, oils, and other lipids which leads to a less nutritious product. By keeping our grains whole, your animals are eating the most nutritious form of the grain possible. Please keep in mind that fowl fed whole grains need grit to help with digestion.

Soy Free

A growing number of consumers are requesting feeds free of soy. Phytic acids in soy have been shown to block the uptake of zinc, magnesium, calcium and iron. Additionally, estrogen mimicking compounds contained in soy have a potentially negative impact to thyroid functioning. For more information, please visit www.westonaprice.org.
